

MERN Request Workflow

Client Request → Middleware → Route → Controller → Response

1. Client Request

Frontend (React/Postman) sends a request to the server.

2. Middleware

Processes or checks the request before it reaches the route. Examples: `express.json()`, `cors()`, authentication.

3. Route

Matches the URL and decides which controller should handle the request.

4. Controller

Contains the main business logic such as validation, database queries, signup, login, etc.

5. Response

Sends the final result back to the frontend.

Example Signup Flow

React Form Submit → POST /signup → `express.json()` Middleware → Route (/signup) → Signup Controller → MongoDB Save → JSON Response → React Receives Response
